BLOWER WITH DOUBLE INLET WHEEL

TECHNICAL FIELD

[0001] The invention relates to a dual blower with a double inlet wheel in an enclosure with two inlets and a single outlet.
5

BACKGROUND OF THE ART

[0002] The invention is directed to dual blowers used for example in exhausting air from a room or series of rooms simultaneously. Since the most costly components of a blower are the electric motor and controls, it is desirable to use a single motor with dual blower wheels mounted on the motor shaft with separate ducting to each wheel rather than requiring separate fans for each inlet. In such an arrangement, the blower wheels may have different diameters and different heights in order to modify the blower characteristics to the quantity of flow air draw into each inlet as required.
10
15

[0003] Examples of dual blower systems are shown in U.S. Patent No. 6,308,770 to Shikata et al., U.S. Patent No. 2002/0119044 to Connor Jr. et al. and U.S. Patent No. 6,030,173 to Bacchiocchi.
20

[0004] A disadvantage of the prior art is that the housing, blower and blower motor are often difficult to access for inspection and maintenance as well as initial installation and wiring.
25

[0005] The present invention provides a dual wheel blower having a simplified scroll enclosure wherein the mechanical and electrical components of the blower are easily access through a removable grate.

5 [0006] Further features of the invention will be apparent from review of the disclosure, drawings and description of the invention below.

DISCLOSURE OF THE INVENTION

10 [0007] The invention provides a blower having an enclosure with side walls defining an internal chamber, an open end forming a first inlet, a second inlet and a single combined outlet. A flow separator plate extends across the internal chamber between the side walls defining a first scroll duct and a second scroll duct. The first scroll
15 duct is in flow communication with the first inlet and the outlet, whereas the second scroll duct is in flow communication with the second inlet and the outlet. A blower wheel is rotatably mounted in the enclosure through an opening in the separator plate having a first wheel
20 portion disposed in the first scroll duct and a second wheel portion disposed in the second scroll duct.

DESCRIPTION OF THE DRAWINGS

[0008] In order that the invention may be readily understood, one embodiment of the invention is illustrated
25 by way of example in the accompanying drawings.

[0009] Figure 1 is an exploded perspective view of a blower enclosure with a horizontal flow separator plate and

double blower wheel rotatably mounted about a vertical axis where the open bottom end of the enclosure provides a first air inlet, a second inlet extends from an upper portion of the enclosure, and a combined outlet receives the output
5 from the dual blower wheels.

[0010] Figure 2 is a like perspective view shown from the view of 2-2 on Figure 1 showing the arrangement of the dual blower wheels housed within a scroll duct.

[0011] Figure 3 is a vertical section view along line 3-
10 3 as indicated in Figure 2.

[0012] Further details of the invention and its advantages will be apparent from the detailed description included below.

DETAILED DESCRIPTION OF PREFERRED EMBODIMENTS

15 [0013] The blower comprises an enclosure 1 having sidewalls defining an internal chamber with an open end 2 within which a removable grate 3 is positioned to provide a first inlet. The enclosure 1 is mounted within a ceiling in order to intake air through the grate 3 and expel the
20 air through the outlet 4.

[0014] A flow separator plate 5 extends across the internal chamber of the enclosure 1 between side walls. Air inlet through the grate 3 and the open end 2 is separated by the flow separator plate 5 from air that is
25 drawn through the second inlet 6 into the upper portion of the enclosure 1 and is also exhausted through the combined outlet 4. A blower according to the invention may be used

for example in a home where the enclosure 1 is mounted in the ceiling of the first bathroom whereas the second inlet 6 is ducted to an intake vent in a second bathroom. Therefore, an advantage of the invention is that only one
5 electrical connection is required and the expense of two separate motors and two separate fan assemblies can be avoided, substantially reducing the cost of venting a second or more rooms or areas in the same room. A further advantage is that by removing the grate 3, the electric
10 motor 7 and blower may be removed or installed as required. Electrical connections can be inspected and installed after the enclosure 1 has been mounted in the ceiling.

[0015] Turning to Figures 2 and 3, the flow separator plate 5 includes an opening through which the blower wheel
15 extends and is rotatable mounted in the enclosure 1, a first wheel portion 8 is disposed in a first scroll duct 10. The first scroll duct 10 is in flow communication with the first inlet (provided by the open end 2 in the enclosure 1) and the outlet 4.

20 [0016] A second wheel portion 9 is disposed in a second scroll duct 11. The second scroll duct 11 is in flow communication between the second inlet 6 and the outlet 4. As best seen in Figure 3, the flow separator plate 5 extends across the internal chamber between the sidewalls
25 of the enclosure 1 and serves to define the separation between the first scroll duct 10 and the second scroll duct 11.

[0017] An advantage of the invention is that the blower wheel comprising the first wheel portion 8 and the second

wheel portion 9 may have different diameters "D" and different heights "H" in order to accommodate different rates of flow required as air is drawn into the first inlet open 2 and second inlet 6. Advantageously, the first wheel
5 portion 8 and second wheel portion 9 can be manufactured separately and then bolted together before connection with the motor 7 in order to easily manufacture the assembly and adapt for different blower capacities. The first scroll duct 10 and second scroll duct 11 can also be manufactured
10 separately and assembled together in a like matter.

[0018] Although the above description relates to a specific preferred embodiment as presently contemplated by the inventor, it will be understood that the invention in its broad aspect includes mechanical and functional
15 equivalents of the elements described herein.
